Lecture notes and text prepared by

Dr. Johanna Daams
Senior Scientist

Simulator Services Department
Ontario Hydro
Toronto, Canada

Rev 0, September 1997

COURSE OBJECTIVES

At the successful completion of this course the participants will be able to describe:

- **Objectives of containment**
- **Requirements for containment design**
- **Methods by which containment designs achieve these objectives**
- **Components of a containment system**
- **Influence of hydrogen, radionuclides and core meltdown on containment design**
- **Approximate magnitudes of containment parameters**
- **Trends in containment design**
- **Specific containment designs**
- **A detailed realization of one specific containment design, the CANDU**
- **Thermodynamics of steam-air mixtures**
- **Mathematical techniques, simple and advanced, for modelling containment features**

Course material consists of overheads, text for the mathematical modelling section of the course, problem assignments, and selected reprints.

Acknowledgments:

The author would like to thank Michael Caterini and Pat Hughey (Ontario Hydro) for the use of their CANDU model descriptions, and Steve Kaasalainen (AECL) for other CANDU design data.
